Introduction

Contents

This questionnaire was sent out to carers when their study child was 198 months old. It is in 10 sections. Section A asks the respondent about different aspects of their relationship with the study child and section B about the study child's use of alcohol, tobacco and drugs and also about antisocial behaviour. Section C contains questions about the study child's activities and interests while section D contains the Strengths and Difficulties Questionnaire (Goodman, 1997), the Short Moods and Feelings Questionnaire (Angold et al., 1995; Messer et al., 1995), the Skuse social cognition scale (Skuse et al., 1997), which is designed to summarise the main features of the social cognition behaviour of individuals, and finally some questions about self harm.

Section E collects measurements of height and weight and asks about dieting, body shape and eating disorders. Then, in section F, the respondent is asked about the health of their study child, in particular about symptoms related to asthma, eczema and tiredness. The respondent is asked about their aspirations and expectations for their study child in section G and then about their study child's attitude to money in section H and their study child's employment history in section I. Finally, section J collects the usual "back page" information on who completed the questionnaire and when.

Questionnaire versions

There was only one version of this questionnaire, although as with all child-based questionnaires there were separate male and female copies. This documentation is based around the female copy. Apart from differences in gender in the text the only difference was that question E20 was not in the male copy.

Sample & response rates

There are a total of 15,107 records on this built file. This number is made up of the 14,676 fetuses in the core ALSPAC sample (regardless of whether or not the 198-month questionnaire was sent out for them or whether it was returned) plus 431 eligible children not in the core sample for whom the questionnaires were sent out. Note that this questionnaire was completed for 225 of these 431 children.

Of the 14,676 fetuses in the core ALSPAC sample, 14,062 were live born. The 198-month questionnaire was sent out for 9,533 (68%) of these live born children. As of 5th March 2010 completed questionnaires had been returned for 5,500 (58%) of these children, which is 39% of the 14,062 live born children. For further information on the ALSPAC sample, please see section 5 of the "Guide to ALSPAC data" which can be found in the "Collaborator Pack" on the ALSPAC documentation CD.

Note that 5 of the 5,725 completed questionnaires belong to children from triplet or quadruplet pregnancies, all of whom are in the core sample. For reasons of confidentiality the data from these questionnaires are not available. The administrative variables TC0001 to TC0007 remain, but TC0007a has been set to 2 "No" and all other variables have been set to -11.

Format of this documentation

The bulk of this documentation consists of the text of the questionnaire and frequency tables of the variables on the data file. These are inserted section by section after the relevant text. Where any editing has occurred a description has been embedded in the questionnaire text.

FILLING IN THE QUESTIONNAIRE

Please use **black** pen. To answer questions simply put a cross in the box which is most accurate in your opinion, like this:

If you make a mistake, shade the box in like this:

then cross the correct box.

If you are answering questions which ask you to give further details, please make sure you write inside the boxes.

If you do not want to answer a question or if it does not apply to you, leave it blank. There are no right or wrong answers. Just tell us what is true for you.

THANK YOU FOR YOUR HELP

Section B: Things Your Teenager Does

The next set of questions are about your teenager's intake of alcohol and drugs, and also her smoking and anti-social behaviour. We realise that these may not be relevant or be difficult to answer, but we would be grateful if you can answer as many as possible, even if you feel you don't really know. We would like to understand if there is a difference between what teenagers say they do and what parents (in general) know.

B1. Has she ever been offered: (Mark **one** box on **each** line).

	Yes, and I know about it	Probably	Possibly	I don't think so	Don't know

Life has many ups and downs. Sometimes people feel very upset. These feelings can be so bad that people may feel suicidal or want to self-harm. We know this is a sensitive subject, but it is important to ask about it now, as it is not uncommon. By finding out about self-harm we can find ways of helping people.

Derived Variables

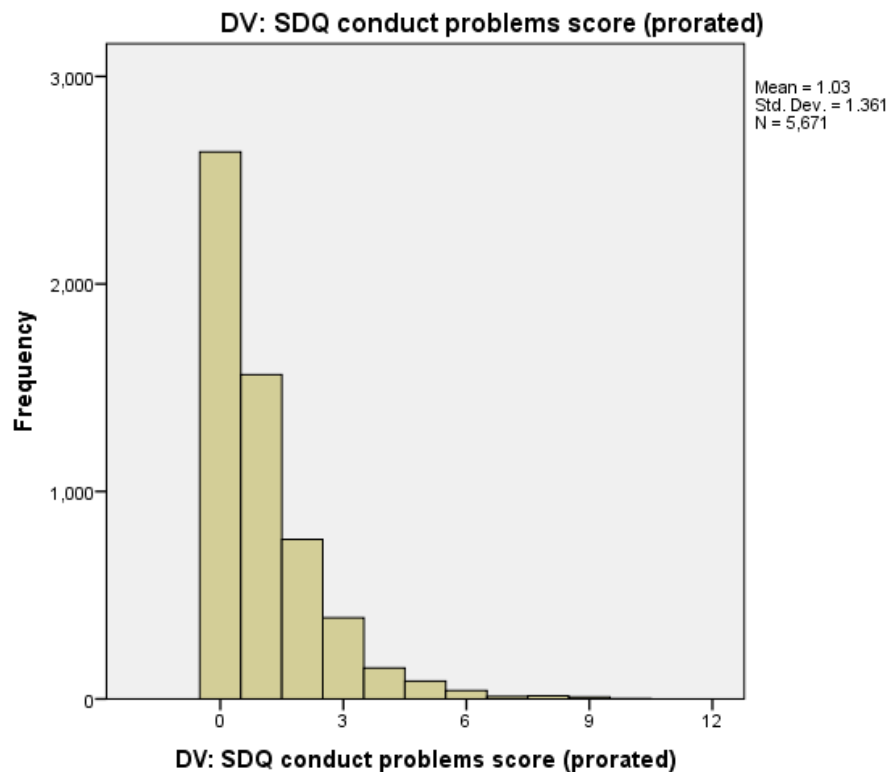

Questions D1 to D25 comprise the parent version of the Strengths and Difficulties Questionnaire by Goodman (1997). The responses are used to create 5 individual component scores and an overall behaviour score. The SPSS syntax used to create each score is included below. Please see www.sdqinfo.com/c1.html for further details

tc4025a DV: SDQ emotional symptoms score (prorated)

E9. Does she spend a lot of her time thinking about food?

Yes ¹ ☐

No ² ☐

Don't know ⁹ ☐

E10. Sometimes people say that they have such a strong desire for food, and that this desire is so hard to resist, that it is like what an addict feels about drugs or alcohol. Does this apply to her?

No ¹ ☐

A little ² ☐

A lot ³ ☐

E11.a) Sometimes people lose control over what they eat, and then they eat a very large amount of food in a short time. Does she ever do this?

Yes ¹ ☐

No ² ☐ → If **no**, go to E12 on page 30

If **yes**,

b) Over the **last 3 months**, how often has this happened?

Hasn't happened ¹ ☐

Occasionally ² ☐

About once a week ³ ☐

Two or more times a week ⁴ ☐

c) When this happens, does she have a sense of losing control over her eating?

Yes ¹ ☐

No ² ☐

Not sure ³ ☐

d) Please describe how much she typically eats during one of her episodes of eating too much:

[Editing note – E1a: For 75 imperial heights for which the inches box was left blank (15 of 5ft and 60 of 6ft) the inches variable was recoded to 0. A single variable for height in cm was then created using a conversion factor of 1in = 2.54cm for imperial measurements (rounding to the nearest integer). If both imperial and metric heights were reported then the metric height was taken unless the two heights were not equivalent and the imperial height was closer to the median (5ft 5in for females and 5ft 11in for males). The variable was set to –9 if the “Don’t know” box had been ticked.]

Derived Variables**Number of contributors**

The number of contributors to the questionnaire is the number of boxes ticked in question J1. It was derived by recoding (1 = 1)(else = 0), summing and then copying across missing values from the components.

Questionnaire completed by...

This variable details the combinations of respondents reported in question J1. It is calculated by recoding values of 1 to powers of 2 (1, 2, 4, 8, 16 and 32 for parts a to f respectively) and all other values to 0 and summing. Missing values in the components are then copied across.

[Editing note – J2: The date of completion was substituted with the date of receipt of the questionnaire from ALSPAC's administrative database if any of the following occurred: The date of completion was not fully completed, the date of completion was not a valid date (e.g. 31st November), the date of completion was later than the date of receipt or the date of completion was earlier than the date on which the questionnaire was sent out by ALSAPAC. This action was flagged in variable TC9990c. The month and year of completion were retained on the built file, but the day was dropped.]

Appendix A

This appendix contains the general verification instructions for scanned questionnaires that are referred to whenever any questionnaire is being verified. This document provides a general overview to the verification process as well as defining abbreviations for standard methods that are used in the specific verification instructions for the questionnaire (see Appendix B).

General Verification Instructions

Document Control

Version	1
Date of introduction	12/03/2008
Date of termination	
Number of pages	2
Author	David Herrick

For general guidance on scanning and verifying see the relevant page on the ALSPAC intranet:

<http://alsp-buzzard.alspac.bris.ac.uk:9080/ALSPNet/projects/Scanning/scanning.html>

The purpose of verifying is to resolve the queries produced by the software. The general aim is to ensure that the exact response is entered, regardless of whether or not it makes sense. Genuinely reported values that are unlikely or even impossible will be resolved at a later stage of the data preparation process.

When verifying a scanned form you will need to reference the specific verification instructions for that form. These will detail the data type of each response on the form and any verification rules additional to the general guidelines specified below:

Code	Data Type	General Verification Guidance
S	A single check box that the respondent can either cross or leave blank.	
M	Multiple check boxes from which the respondent is expected to either cross one or leave all blank.	<p>Occasionally respondents will cross more than one box; the verification instructions for the form will detail how to resolve any such occurrences. The following codes are used as shorthand for commonly occurring instructions:</p> <ul style="list-style-type: none">• 7: If more than one box is crossed, choose the one with the lowest code number.• 8: If more than one box is crossed, choose the one with the highest code number.• I: If „Yes“ and „No“ are both crossed in a stand-alone question, then leave the response blank. However, if „Yes“ and „No“ are both crossed in a lead question then it should be possible to determine the intended response from the information in the follow up questions. <p>If it is clear that the respondent attempted to cancel a cross by filling in a box then discard that value.</p>

N	A numerical response. The respondent is provided with one or more boxes within which they are expected to write Arabic numerals (one per box).	<p>The verifier will query anything that it cannot recognise as a number. Please note the following general guidelines:</p> <ul style="list-style-type: none"> • If "N/A" or question marks or anything similar are written in the boxes, leave as blank. • If more than one digit has been written in any box then enter the value if it is possible to do so (i.e. there were enough boxes but the digits were misplaced). However, if the response is too large for the number of boxes (e.g. 11 where only a single digit is expected) then record it in the form notes and leave the value as blank. • If the answer is not legible on the scanned image and therefore cannot be corrected then record in the form notes and leave the value as blank. It may be possible for the value to be corrected later on by looking at the paper copy of the questionnaire. <p>In addition the verifier may also be set up to query values outside of a specific range (this will be documented in the verification instructions for the form). If a queried value is clearly what was written then accept it even if it is outside the range of values in the verification rule. This applies even if the value is impossible (e.g. value 34 in a response for number of hours per day).</p>
D	A date. The respondent is provided with boxes within which to write the numerals of a date. Some boxes may be pre-filled.	The general guidelines for numerical responses apply here. In addition note that the verifier will query any invalid dates, including any dates where there are empty boxes. As with numerical responses these should be left as reported by the respondent. In the days of keyed questionnaires coders were instructed, for example, to use the date of receipt to fill in missing dates of completion. This sort of thing is not required of validation – the date captured should be as reported.
C	Constrained text. The respondent is provided with a series of boxes within which to write text; one character per box.	<p>The text should be entered as close as is possible to what the respondent wrote, so observe errors in spelling, grammar etc.</p> <p>It is not possible to enter more characters than there are boxes on the questionnaire. Longer responses must be recorded in the form notes.</p> <p>Note that it is not possible to enter the character "?". If the respondent wrote "?" as part of the response in the text box then enter this as "[Question mark]".</p>
T	Unconstrained text. The respondent is provided with a large box within which to write freely.	<p>The verifier will attempt to interpret this but will almost always flag for verification if anything is detected. Simply type in the text response as best you can. The text should be entered as close as is possible to what the respondent wrote, so observe errors in spelling, grammar etc. Note that if the response is split over several lines then if captured in multiple lines this formatting can be kept, but new line breaks cannot be inserted.</p> <p>Note that it is not possible to enter the character "?". If the respondent wrote "?" as part of the response in the text box then enter this as "[Question mark]".</p> <p>Occasionally the verification instructions for the form will instruct you to enter something new in an unconstrained text box (e.g. details of multiple crossing in data type M). To do this click on the box on the form and start typing in the grey area below. In order to differentiate between text from the respondent and text entered at verification start anything you add with "V: " and enclose in square brackets, e.g. "[V: 1+2+5]".</p>

Appendix C: Questionnaire Methodology

Administration

Questionnaires were identified by a 9 digit check-summed identifier (QUESTIONNAIRE ID) that is unique to both the recipient and the particular questionnaire. These numbers, together with bar codes, were printed on sticky labels that were then applied to the front pages of the questionnaires prior to being mailed out. If a response was not received after 3 weeks a reminder letter was sent. If there had still not been a response after a further 3 weeks then a second reminder was sent out. If there was still no response 3 weeks after the second reminder had been sent then the usual procedure was for the case to be flagged as being eligible for personal contact by a member of the Family Liaison Team. However, due to resource issues resulting from the number of concurrent data collections ongoing at the time, this final step was not enacted for this particular questionnaire.

The receipt of questionnaires was logged by the Questionnaire Administration Department using a bar code scanning system, which recorded the date of receipt. If returned blank by the respondent (but not, for example, if returned as “not known at this address”) this was flagged. The questionnaires were examined and if badly completed (e.g. marks not in boxes) or if text was written outside of supplied boxes then the office use box on the back page was marked in order to flag that detailed checking was required at the verification stage (see below). Any signed comments on the back page were dealt with as appropriate and the completed questionnaires batched together in batches of 20, separately for the male and female versions.

Data handling

The questionnaires were designed using the Teleform data capture software. The questionnaires were booklets with A5 pages, stapled in the folded spine. The expected responses to the questions fall into four categories: self-coding tick boxes, numeric, free text and occasionally constrained print (text entered one letter to a box).

Completed questionnaires had the spine guillotined off and were then fed into a document scanner. The data were captured from the resulting images by the Teleform software. Any anomalies, such as multiple ticks or numeric / constrained print responses that the system could not interpret were flagged by the software and corrected by an operator at the verification stage. During verification the captured free text was also checked for accuracy. The rules for correcting multiple ticks and other anomalies were set out in the ALSPAC general coding instructions (see Appendix A) and the specific coding instructions for this questionnaire (see Appendix B). The numeric, tick box and any constrained print data were then exported to an SPSS data file and the free text exported to a database.

The SPSS data files then had appropriate variable and value labels applied. The administrative identifier (QUESTIONNAIRE ID) was converted to the research identifiers ALN & QLET. At the end of this process the data were classified as clean; they are deemed to accurately represent what the respondent actually entered on the questionnaire, except that the text responses have not been processed. The free text is available on request under special confidentiality rules for projects that require it.

In order to prepare the data for general release the clean data were matched to the information about dispatch and return held in the ALSPAC administrative database. This enabled creation of variables for all members of the cohort indicating whether or not a

questionnaire was sent out, whether it was returned etc. The variables were renamed according to a unique system to ensure there are no conflicts with variable on other data files. All variable names start with the letters "tc" which are followed by three digits and occasionally a further letter. Then the data from the back page (section J) were edited as described in the relevant section of this documentation.
