Introduction

A series of six short questionnaires were sent out to study children between the ages of 65 and 85 months. The primary purpose of these questionnaires was to get the children used to completing questionnaires for themselves. The questionnaires were all in A4 format on 4 sides of paper. Each questionnaire asked the child to draw one or more pictures as well as provide tick box responses in some cases. At the time of publications, the images have all been scanned electronically but have not been coded in any way. Similarly, any free text written by the child is available as an electronic image but has not been coded unless stated otherwise.

Given the brevity of the six questionnaires, the data and therefore the documentation has been combined into one file.

Format of this documentation

The bulk of this documentation consists of the text of each questionnaire as it was sent followed by frequency tables of the variables on the data file. These are inserted section by section after the relevant questionnaire text. Where any editing has occurred a description has been added before the relevant frequency tables. The algorithms used to create derived variables are also included where appropriate. The administrative variables for each questionnaire are provided directly after the questionnaire text.

Sample & response rates

There are a total of 15458 records on this built file. This number is made up of the 14,676 fetuses in the core ALSPAC sample plus 782 eligible children not in the core sample (regardless of whether or not any of the six questionnaires were sent out to them or whether they were returned). Detailed response rates for each questionnaire are provided under each questionnaire section. For further information on the ALSPAC sample, please see section 6 of the "Guide to ALSPAC data".

Note that a very small number of completed questionnaires belong to children from triplet or quadruplet pregnancies, all of whom are in the core sample. For reasons of confidentiality the data from these questionnaires are not available. All data has been set to –11 for all triplets and quadruplets.

Dates of completion

It should be noted that these questionnaires did not ask the child to provide the date on which they completed it. Therefore, the date of receipt has been recorded and used to calculate age. Therefore calculated age is the age of *receipt* of the questionnaire by the ALSPAC office rather than age at completion of the questionnaire.
